Hydrapeel Serum

Hyper-Moisturizing Serum with Low Molecular Weight Hyaluronic Acid

Hyaluronic acid is produced in the skin mainly by fibroblasts and keratinocytes, with a life span in our skin of 24 hours, which means that 50% is metabolized in less than a day. Over the years our body produces less HA, being one of the causes of skin aging.

Hydrapeel Serum combats the natural loss of hyaluronic acid from our skin.

Hydrapeel Serum, with pure hyaluronic acid that, thanks to its ability to penetrate the deepest layers of the skin, as if it were a “molecular sponge”, fills the skin from the inside. Pure low molecular weight hyaluronic acid is capable of retaining more than 1,000 times its weight in water, restoring the elastic properties of the skin.

The skin is smoother, filling wrinkles from the inside, achieving as a result a more hydrated, flexible and turgid skin.

It contains sunscreen to prevent skin irritation after biochemical peeling. It is essential to avoid sun exposure after treatment.

How to use

With clean and toned skin, apply Hydrapeel Serum after Hydrapeel treatment applied by a professional. Also, after a peeling with Pureglycopeel.

Use as many times as necessary, day and night.

Avoid the area around the eyes.

97%

skin-friendly ingredients of natural origin:

Glycerin, Xanthan gum.

3%

additional ingredients to ensure the stability and safety of the formula:

Solar filters to protect against the sun, Organic preservative.

Hydrapeel Serum is designed as part of the Hydrapeel treatment and formulated to meet skin needs after a biochemical peeling with the professional Hydrapeel product.

After a biochemical peeling treatment, it is essential to follow the advice of the professional and continue with the home treatment to achieve the expected results.

Hydrapeel generates an action on the skin that multiplies the effect of hyaluronic acid, enhances it and increases its production in the dermis.

The treatment produces a specific cell renewal, due to the clinical selection of the acids used, resulting in a mild-medium degree peeling, which produces a renewal of the skin cells, eliminating the mature superficial cells and favoring the growth of young cells.

A constant renewal of skin cells is vital to have high levels of hyaluronic acid in our dermis, preventing the appearance of sagging skin and managing to maintain youthful skin without wrinkles.
