Melanze Cream and Biochemical Peel

MELANZE CREAM, product for the dermatological treatment of spots, melasmas, freckles and hyperpigmented areas due to unwanted accumulations of melanin.

Melanze Cream contains a very effective cosmetic complex to homogenize and lighten the skin interfering with the formation of melanin, the natural pigment responsible for skin colour.

Thanks to the structural knowledge of the tyrosinase enzyme naturally present in fungi, Melanze Cream is capable of inhibiting the activity of the enzyme that generates melanin, obtaining high efficacy that illuminates the dermis without any toxicological response, perfect for sensitive skin.

The efficacy and stability in the formula are clinically proven. It exerts a photoprotective effect (prevention of skin damage induced by UV rays) obtaining visible results in the reduction of melanin in just two months.

Provides a more even and less pigmented skin tone, reduces unwanted hyperpigmented areas and protects the skin from future blemishes.

Scientific results show a 24.7% reduction in melanin formation, blocking the enzymes that produce it.

In 30 days, the tone of melasmas is reduced by up to 50%, which improves until reaching a reduction of 75% at 60 days.

Anti-hyperpigmentation
Effect

Whitening Complex

Contains sunscreen to prevent skin irritation after biochemical peeling.
It is essential to avoid sun exposure after treatment.

How to use

With clean and toned skin, apply Melanze Cream after a professional treatment with Melanze or Melanze Plus. Also, after a peeling with Pureglycopeel.

Use as many times as necessary, day and night.

Avoid the area around the eyes.

73.1 %

skin-friendly ingredients of natural origin:

Daisy Extract, Vegetable Emulsifier, Propylene Glycol, Vegetable Oil.

4%

additional ingredients to ensure the stability and safety of the formula:

Solar filters to protect against the sun, Phenoxyethanol, Ethylhexylglycerin and Carbomer.

Melanze Cream is designed as part of the Melanze treatment and formulated to meet skin needs after a biochemical peeling with the Melanze or Melanze Plus professional product.

After a biochemical peeling treatment, it is essential to follow the advice of the professional and continue with the home treatment to achieve the expected results.

It is necessary that before carrying out any anti-stain treatment, a personalized and exhaustive study is carried out by a specialist. The professional will determine what has caused the hyperpigmentation and the best alternative to treat it, in addition to ruling out any malignant lesion on the skin.

Skin colour is determined by the type, quantity, and distribution of melanin, a natural pigment that runs through our skin. Natural ageing, air pollution and UV exposure induce abnormal accumulation of melanin in the skin, leading to sun spots, freckles, melasmas, liver spots, etc. Giving rise to accumulations of unwanted melanin.

Once the damage to our skin has occurred, it is possible to remedy it using treatments such as Melanze, which reduces the amount of pigmentation in the skin and protects the cells of the dermis so that the damage is not permanent.

Melanze is a treatment designed to carry out a correct biochemical exfoliation, formulated with acids that act directly on melanin deposits. An intense fundamental treatment for the reduction of the concentration of melanin in a localized way and to combat the deteriorated appearance of the skin.

MELANZE TRANEXAMIC HOME. Biopeeling for home use for the dermatological treatment of blemishes, melasmas, freckles and hyperpigmented areas due to unwanted accumulations of melanin.

Contains a battery of acids carefully chosen for their effect on the skin, designed to act against dermal hyperpigmentation, affecting each of the steps of melanin formation.

Compared to the one for professional use, this product has a moderate concentration of active ingredients, designed so that all types of users can use the product safely with all the advantages it offers.

It is extremely important to strictly follow the instructions for use to avoid unwanted adverse reactions.

It is a medium-grade biochemical peeling, designed to attack the superficial layers of the dermis, achieving noticeably smoother skin from the first application. The most visible marks and spots on the skin will gradually disappear with continued use. The optimal frequency is every two or three weeks, depending on the results observed, since each skin is special and reacts at its own pace.

Depending on the desired results, the time between biopeeling treatments can be extended so that the skin rests for longer. It is recommended not to use at times of the year with high sun exposure. Designed for mature skin, with accentuated signs and marks or with more serious problems of pigmentation and roughness of the skin.

Biopeeling with 20% acids:

Glycolic Acid 14%

Ferulic Acid 0.5%

Kojic Acid 0.7%

Tranexamic Acid 4.8%

Niacinamide 5%

Vitamin C 2%

How to use

With clean and toned skin, apply a few drops to the area to be treated and leave for 10-15 minutes or the time recommended by the professional.

If any adverse reaction or intense itching is observed, remove immediately with Post-Peel Neutralizing Solution. Avoid the area around the eyes.

96 %

skin-friendly ingredients of natural origin:

Alcohol, Glycerin.

4%

additional ingredients to ensure the stability and safety of the formula:

Phenoxyethanol, Ethylhexylglycerin.

Melanze Tranexamic Home is intended as part of the Melanze treatment and formulated to continue the treatment at home, under the guidance of a professional.
